
Artificial Intelligence Is Not a Threat — Yet
Elon Musk、Stephen Hawking and Bill Gates are concern about Artificial intelligence.
Eliezer Yudkowsky explains how the AI apocalypse might unfold was outlined and thinks that if we don't get on top of this now it will be too late.
Nick Bostrom used paperclip maximizer experiment to explain that artificial intelligence will control mankind and even the whole universe.
The author doubts that artificial intelligence will pose a threat to human beings.
First, Alan Winfield is not impossible to think that AI will cause danger to human beings, but the possibility is extremely low.
Second, Eric Schmidt and Andrew Ng believe that the development speed of AI is much lower than expected, and human beings have time to stop it.
Third, Steven Pinker clarifies that AI fully capable of solving problems, but with no desire to destroy innocents or dominate the civilization.
Fourth, Michael Chorost believes that AI has no feelings and will not produce subjective emotions, so it will not pose a threat to human beings.
Given the zero percent historical success rate of apocalyptic predictions, coupled with the increasingly gradual development of AI over the decades, we have plenty of time to build in fail-safe systems to prevent any such AI apocalypse.
